Event Title : CT:ABDOMEN W/O AND W/NON-IONIC

Performed on Date : 27-FEB-2008 08:54:00

MRN Number :332578

Clinical History: 46-year-old female with right flank pain and a family history of renal calculi. A poor post-contrast-enhanced abdominopelvic CT was performed for further evaluation. The time of dictation, there are no prior CT scans available for comparison. Technique: No oral contrast was administered. Sequential pre- and post-contrast-enhanced axial images of the abdomen and pelvis were obtained. Findings: The lung fields are clear. There are no destructive distal calcifications. There is a CT evidence of nephroureterovesiculolithiasis. Following administration of intravenous contrast there is prompt, bilateral, symmetric renal parenchymal enhancement and excretion. There are no focal renal lesions, there was a dilatation of either renal collecting system. There are no filling defects appreciated within the opacified uroepithelium. Incidental note is made of gonadal vein opacification bilaterally greater on the right than the left. There are no focal lesions within the liver, spleen, pancreas, or either adrenal gland. There are no dilated loops of bowel, free intraperitoneal air or fluid. There are small paraaortic lymph nodes which are not enlarged by CT criteria. The largest on the left measures 0.7 x 0.7 cm on image 34. An aortocaval lymph node is present on image 37 which measures 0.6 x 0.4 cm again not pathologically enlarged. There are no dilated loops of bowel, free intraperitoneal air, or fluid. Cystic changes are present in both adnexa commensurate with the patient's age and menstrual status. These are present on image 61. No pelvic masses are identified. There are no filling defects within the urinary bladder. There is a right inguinal lymph node which measures 1.2 x 1 cm on image 75 which also is not enlarged by CT criteria. The osseous structures are intact.

Impression: Normal CT urogram.

Attending Radiologist: ZAWIN, MARLENE

Ordered By: WALTZER, WAYNE
